General Social Survey, Cycle 19, 2005 [Canada]: Time Use Survey, Main File (GSS, Cycle 19, 2005: Time Use Survey, Main)

Enquête Sociale Générale, cycle 19, 2005 [Canada]: L'emploi du Temps, Dossier d'épisode

Overview	
Type	General Social Survey
Identification	gss-12M0019-E-2005-c-19-m
Version	Production Date: 2006 1.0
Series	The two primary objectives of the General Social Survey (GSS) are: to gather data on social trends in order to monitor changes in the living conditions and well being of Canadians over time; and to provide information on specific social policy issues of current or emerging interest.
Abstract The General Social Survey (GSS) program gathers data on social subjects in order to monitor changes in the living conditions and well being of Canadians over time and to provide immediate information on specific social policy issues of current or emerging interest. Cycle 19 of the GSS is the fourth cycle dedicated to the topic of time use - previous cycles were carried out in 1986, 1992 and 1998.	
Kind of Data	Survey data, microdata file
Unit of Analysis	Individuals

Scope & Coverage

Scope

In the survey, all respondents were contacted by telephone, mainly by employing Random Digit Dialling (RDD), a telephone sampling method. Households without telephones were therefore excluded; however, persons living in such households represent less than 2% of the target population. Survey estimates have been adjusted (i.e. weighted) to account for persons without telephones. The tacit assumption is that, given the small number of people without telephones, their characteristics are not different enough from those of the rest of the target population to have an impact on the estimates. Since no one without a telephone is in the sample, this assumption cannot be verified using GSS data. It has, however, been verified with data from the Labour Force Survey.

Keywords	Ballet, Books, Comedy, Farming, Housework, Leisure Time, Libraries, Museums, Music Festivals, Newspapers, Outside Maintenance, Performing Arts, Periodicals, Photography, Physical Activity, Reading, Recreation, Shopping, Social Behaviour, Sports, Theatre, Time Crunch, Time Use, Training
Time Period(s)	2005
Countries	Canada

Geographic Coverage

Canada, provinces

Universe

Included: All individuals aged 15 and over living in Canada.

Excluded: Residents of the Yukon, Northwest Territories, and Nunavut, and full-time residents of institutions.

Sampling

Sampling Procedure

Data for Cycle 19 of the GSS were collected in 11 monthly samples from January to November 2005 with data collection for the November sample extending until mid-December. The sample was evenly distributed over the 11 months to counterbalance as much as possible the seasonal variation in the information gathered. Households were selected for the survey by Random Digit Dialling. The telephone numbers in the sample were selected using the Elimination of Non-Working Banks technique. This sampling technique is a method in which an attempt is made to identify all working banks for an area (i.e., to identify all sets of 100 telephone numbers with the same first eight digits containing at least one number that belongs to a household). Thus, all telephone numbers within non working banks are eliminated from the sampling frame.

In order to carry out sampling, each of the ten provinces was divided into strata, i.e. geographic areas.

Many of the Census Metropolitan Areas (CMAs) were each considered separate strata. This was the case for St. John's, Halifax, Saint John, Montreal, Quebec City, Toronto, Ottawa, Hamilton, Winnipeg, Regina, Saskatoon, Calgary, Edmonton, Vancouver and Victoria. CMAs not on this list are located in Quebec and Ontario. Two more strata were formed by grouping the remaining CMAs in each of these two provinces. Finally, the non-CMA areas of each of the ten provinces were also grouped to form ten more strata. This resulted in 27 strata in all.

Response Rate

The overall response rate during collection for Cycle 19 was 58.6%.

Weighting

When a probability sample is used, as is the case for the GSS, the principle behind estimation is that each person selected in the sample represents (in addition to himself/herself) several other persons not in the sample. For example, in a simple random sample of 2% of the population, each person in the sample represents 50 persons in the population. The number of persons represented by a given person in the sample is usually known as the weight or weighting factor of the sampled person.

The estimates for GSS Cycle 19 can be obtained from the microdata file which contains questionnaire responses and associated information from 19,597 respondents. Four weighting factors were placed on the Main File. They are listed and explained below:

WGHT_PER: This is the basic weighting factor for analysis at the person level, i.e. to calculate estimates of the number of persons (non-institutionalized and aged 15 or over) having one or several given characteristics. WGHT_PER should be used for all person-level estimates that do not involve the Culture, Sports and Physical Activity, Social Networks or Transportation from sections 10 and 11 of the questionnaire.

WGHT_HSD: This is the usual GSS household weight, to be used only for estimate of household characteristics. For example, to estimate the number of households that live in low-rise apartments, WGHT_HSD should be summed over all records with this characteristic.

As a result of the splitting the sample for Section 10 and Section 11 in the questionnaire (refer to the Instrument Design section above), the following two weights were created. **WGHT_CSP:** This is the weight that must be used for estimates that involve questions on Culture, Sports and Physical Activity (Section 10A) of the questionnaire. This weight is zero for respondents who completed the Social Network and Trust (Section 10B) and Transportation (Section 11) sections.

WGHT_SNT: This is the weight that must be used for estimates that involve questions on Social Networks and Trust (Section 10B) and Transportation (Section 11). This weight is zero for respondents who completed the Culture, Sports and Physical Activity (Section 10A) section.

Data Collection

Data Collection Dates	start 2005-01 end 2005-12
Data Collection Mode	Computer assisted telephone interviewing

Data Collection Notes

Computer assisted telephone interviewing (CATI) was used to collect data for the GSS, using Random Digit Dialing methods. Respondents were interviewed in the official language of their choice. Interviews by proxy were not allowed. Data

collection began in January 2005 and continued through to December 2005. The sample was evenly distributed over the eleven waves to counterbalance as much as possible the seasonal variation in the information gathered.

All interviewing took place using centralized telephone facilities in four of Statistics Canada's regional offices, with calls being made from approximately 09:00 until 21:00, Monday to Saturday inclusive. The four regional offices were: Sherbrooke, Halifax, Edmonton and Winnipeg. Interviewers were trained by Statistics Canada staff in telephone interviewing techniques using CATI, survey concepts and procedures.

The majority of interviewers had previous experience interviewing for the GSS.

Data collection for this reference period: 2005-01-12 – 2005-12-13. Responding to this survey is voluntary. Data are collected directly from survey respondents.

Data Processing & Appraisal

Estimates of Sampling Error

Even a census of the population of interest produces estimates subject to error. While these are called non-sampling errors, estimates from samples still contain errors of this type. Common sources of these errors are imperfect coverage, non-response, response errors, and processing errors.

Coverage of the GSS-19 targeted population by the RDD frame is estimated to be more than 93% complete; rates of telephone service are very high in Canada. These rates are high for virtually all sociodemographic groups, but are lowest among those households with the lowest incomes. As a result persons living in such households are slightly under-represented in the GSS-19 sample. In addition, while every effort was made to avoid non-response, the non-response rate for GSS-19 was 41%. Little or nothing is known about the non-responding cases, and so the results may be biased to the extent that the nonresponding cases differ from those that provided responses.

Even a census of the population of interest produces estimates subject to error. While these are called non-sampling errors, estimates from samples still contain errors of this type. Common sources of these errors are imperfect coverage, non-response, response errors, and processing errors.
