Overview

Type	General Social Survey
Identification	gss-12M0002-E-1986-c-2-main
Version	1.0
Series	The two primary objectives of the General Social Survey (GSS) are: to gather data on social trends in order to monitor changes in the living conditions and well being of Canadians over time; and to provide information on specific social policy issues of current or emerging interest.

Abstract
The General Social Survey (GSS) has two principal objectives: first, to gather data on social trends in order to monitor changes in Canadian society over time; and secondly, to provide information on specific policy issues of current or emerging interest. The GSS is a continuing program with a single survey cycle each year. This survey collected data on social mobility and time use of Canadians, and examined language knowledge and use. Topics include occupation, education and other characteristics of Canadians and their parents, language knowledge and use, activities over a 24-hour period, and data for each episode of time use. This cycle contains three files, the main file, time use summary file and episode file. The main file is composed of 286 variables covering general background, language and social mobility variables. The time use summary file consists of one record per respondent and summarizes the total time spent on each of 95 activities and the 10 major categories, total time spent at each location and total time spent with various persons. In addition, it contains a subset of characteristics found on the main file. The time use episode file consists of all episodes reported by respondents. Each respondent generated a variable number of records depending on the number of episodes reported. For each episode, there is information on the activity, start and end time, duration, location and an indication of who the respondent was with for that episode.

Kind of Data	Survey data, microdata file
Unit of Analysis	Individual

Scope & Coverage

Keywords	Activities, Business, Day care, Dwelling, Educational attainment, Entertainment, Ethnic origin, Hobbies, Housework, Income, Job search, Language, Mother tongue, Occupation, Recreation, Religion, Salaries and wages, Television viewing, Transportation, Travel
Time Period(s)	1986
Countries	Canada

Geographic Coverage
Canada, Provinces

Universe
Included: Persons 15 years of age and older living in Canada's Provinces
Excluded: Persons living Yukon and Northwest Territories, full-time residents of institutions.

Producers & Sponsors

Primary Investigator(s)	Statistics Canada. Housing, Family and Social Statistics Division, StatCan

Other Producer(s)	Statistics Canada

Sampling

Sampling Procedure
Stratified Sample
 Two random Digit Dialling (RDD) sampling techniques are used. For Newfoundland and Ontario, the Elimination of Non-working Banks method was used. For the other provinces, the Waksberg method was used. The sample size was 16,390.

Response Rate
The overall response rate for the GSS was approximately 80%.

Weighting
Main File=(FWGT_OS)

Summary File= (FWGT_MS)
 When a probability sample is used, as was the case for the GSS, the principle behind estimation is that each person seleeted in the sample 'represents' (in addition to himselflherself) several other persons not in the sample. For example, in a simple random sample of 2% of the population, each person in the sample represents 50 persons in the population.
 An overall weighting factor (FINAL WT) was placed on each record to indicate the number of sampled persons that the record represents. This weighting factor refers to the number of times a particular record should contribute to a population estimate. For example, 10 estimate the number of persons who have graduated from high school, the value of FINAL_WT is summed over all records with this characteristic. This weighting process is described in Section 7.1.

Data Collection

Data Collection Dates	start 1986-10-25 end 1986-11-21 start 1986-11-22 end 1986-12-22
Time Period(s)	single 1986

Data Collection Notes
Responding to this survey is voluntary. Data are collected directly from survey respondents.

Data Processing & Appraisal

Estimates of Sampling Error
Statistics from the General Social Survey (GSS) databases are estimates based on data collected from a small fraction of the population (roughly one person in 2,000) and are subject to error. The error can be divided into two components: sampling error and non-sampling error

Sampling error is the difference between the estimate derived from a sample and the result that would have been obtained from a population census using the same data collection procedures. For a sample survey such as the GSS, this error is estimated from the survey data. The measurement of error used is the standard deviation of the estimate. When a sampling error is more than 33 1/3% of the estimate itself, it is considered to be too unreliable to be published. In such a case, the symbol "-- " appears in statistical tables in place of the estimate. When the sampling error is between 16 2/3% and 33 1/3%, the corresponding estimate is accompanied by the symbol " * " in a table. Such estimates should be used with caution. Finally, all estimates with a sampling error of less than 16 2/3% can be used without restriction.

All other types of errors, such as coverage, response, processing, and non-response, are non-sampling errors. Many of these errors are difficult to identify and quantify.

Coverage errors arise when there are differences between the target population and the surveyed population. Households without telephones represent a part of the target population that was excluded from the surveyed population. To the extent that this excluded population differs from the rest of the target population, the estimates will be biased. Since these exclusions are small, one would expect the biases introduced to be small. However, since there are correlations between a number of questions asked on this survey and the groups excluded, the biases may be more significant than the small size of the groups would suggest.

Individuals residing in institutions were excluded from the surveyed population. The effect of this exclusion is greatest for people aged 65 and over, for whom it approaches 9%. In a similar way, to the extent that the non-responding households and persons differ from the rest of the sample, the estimates will be biased. The overall response rate for the GSS was approximately 80%. Non-response could occur at several stages in this survey. There were two stages of information collection: at the household level and at the individual level. Non-response at the household level averaged 6%. Non-response also occurs at the level of individual questions. For most questions, the response rate was high and, in tables, the non-responses generally appear under the heading "not stated".

While refusal to answer specific questions was very low, accuracy of recall and ability to answer some questions completely can be expected to affect some of the results presented in the subsequent chapters. Awareness of exact question wording will help the reader interpret the survey results.

Since the survey is cross-sectional, caution is required in making causal inferences about the association between variables. Observed associations may be a reflection of differences between cohorts, period effects, differences between age groups or a combination of these factors.
